

## MI TÖLTI KI AZ ELMÉT? \*

**ZENON PYLYSHYN**

Rutgers Center for Cognitive Science

*"If one were to go by popular science articles on the brain one would have to conclude that we know where everything is located in the brain and therefore we know everything about it except how it manages to do things like think. But I did choose the title deliberately because I believe that what we do here at the Center for Cognitive Science is precisely that we study what is in the mind. Let me explain. The term "mind" has been associated with psychology at least as far back as William James who defined psychology as the "Science of Mental Life". Yet in the past 50 years it has fallen into disfavor. But there is good reason to believe that this was a mistake and that psychology really is about the mind. And it particular that the explanations of behavior have to take into account what is in the mind."*

*Keywords: cognitive science, symbolic representation, cognitive architecture.*
