Abstract: The classical psychometrical procedures are focusing on the product of the cognitive function. They have a statical and a descriptive character, minimizing the importance of the connection between learning and intelligence. The formative diagnosis has in his center the process, so it is dynamic and formative. It measures the cognitive and learning potential focusing on the link between intelligence and learning. In their theories the intelligence is the cognitive profit of a learning situation.

Keywords: classic psychometria formative diagnosis, dynamic evaluation, psychological testing, componential analysis
