*There is currently a competition between some theories that propose to explain the application of past information in new, contextually different situation. We argue that in this problem 3 factors are important: the context of learning, cognitive flexibility and the metacognitive strategies. This paper suggest that the role of analogy is central in academic learning, and in organizational learning. We consider that in a changing society people gets salary for application of information, not for simple reproduction of it. In this case the intervention programs for adults must be elaborated on metacognitive level, not on cognitive level.*

*Keywords: analogy, metacognition, cognitive flexibility, physical, social, mental context.*
