**Abstract:** Wittgensten in his Tractatus indicated the possibility of existence of 16 binary logical operator. The aim of this paper is an empirical study about the usage of logical operators. In our experiment we use elementary propositions without context, because the symbolization with context is very difficult. In the conclusions we say the number of logical operators what we use is 4-5, but the more frequent is the conjunction. Then, the possibility of logical manipulation of the information is limited.

**Keywords:** logic of proposition, logical operators frequency, logical manipulation of the information.
