

A személyiség tulajdonságainak befolyása a kockázati döntésekre, külső és belső hatások függvényében

DEREGÁN SZIDÓNIA¹

Abstract

The scientific research aimed at three areas in the field of decisions, presenting a certain risk basis. The first direction of scientific research concerns the influence of external factors on decisions at risk or in risk situations (Kahneman, D. and Tversky, A, 1979). The second direction reveals that personality traits have a predictive validity upon the risk-based decision making (Zuckerman, M., and Kuhlman DM 2000, Nicholson, N et.al.2005). The third strand of research addresses the influence of the impact of self-regulation, limited cognitive capacity and depletion on performance in the process of risk-based decision making (Baumeister, R. F. 2000, Botvinick, M M. et. al.. 2001, Bruyneel, S, 2008).

Keywords

Personality traits, Risk-based decision, Framing, Fatigue, Risk-orientation
