**Abstract:** The main sources for the difference between the output of those persons with outstanding memory and average memory skills are to be found in mnemotechnique. In this study we present some of these proceeding. Furthermore, we would also like to draw attention on the individual patterns of memory operation and the modular organization and operation of memory, through the presentation of a brilliant output, based on an image-association technique. Mnemotechniques are also task-specific with outstanding talents. This can be explained by the fact that the recalling output depends on the informational content of the memorizable task.

**Keywords:** mnemotechnique, mnemonist, modular memory subsystems
